PF: for the habitat types that can have a non-priority as well as a priority form (6210, 7130, 9430) enter "X" in the column PF to indicate the priority form.

NP: in case that a habitat type no longer exists in the site enter: x (optional)

Cover: decimal values can be entered

Caves: for habitat types 8310, 8330 (caves) enter the number of caves if estimated surface is not available.

Data quality: G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation)

3.2 Species referred to in Article 4 of Directive 2009/147/EC and listed in Annex II of Directive 92/43/EEC and site evaluation for them

Group: A = Amphibians, B = Birds, F = Fish, I = Invertebrates, M = Mammals, P = Plants, R = Reptiles

S: in case that the data on species are sensitive and therefore have to be blocked for any public access enter: yes

NP: in case that a species is no longer present in the site enter: x (optional)

Type: p = permanent, r = reproducing, c = concentration, w = wintering (for plant and non-migratory species use permanent)

Unit: i = individuals, p = pairs or other units according to the Standard list of population units and codes in accordance with Article 12 and 17 reporting (see [reference portal](#))

Abundance categories (Cat.): C = common, R = rare, V = very rare, P = present - to fill if data are deficient (DD) or in addition to population size information

Data quality: G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation); VP = 'Very poor' (use this category only, if not even a rough estimation of the population size can be made, in this case the fields for population size can remain empty, but the field "Abundance categories" has to be filled in)

Other Site Characteristics

Extremo SW de la isla de Formentera. La zona terrestre está constituida por una plataforma tabular de rocas calcáreas del Terciario que forma acantilados marinos de mayor o menor pendiente en todo su perímetro. La zona marina se encuentra sobre una plataforma litoral constituida, predominantemente, por rocas y gravas con algunas manchas de arena. El recubrimiento vegetal es importante y la profundidad máxima que se alcanza ronda la cota de los 40 metros.

4.2 Quality and importance

En esta zona nidifican varias especies prioritarias del Anexo I de la Directiva Aves, entre las que destaca Puffinus mauretanicus, unica especie de aves endémica de las Baleares y que posee en el Cap de Berberia una de sus colonias más importantes. Otras especies nidificantes en la zona son Calonectris diomedea, Phalacrocorax aristotelis desmarestii y Larus audouinii. La calidad e importancia de este lugar se basa en la importante presencia de praderas de Posidonia oceanica, en el interés que posee para la tortuga marina Caretta caretta, especialmente para la invernada de una gran cantidad de ejemplares juveniles y para las poblaciones de Tursiops truncatus instaladas en las costas de Ibiza y Formentera. Además las poblaciones de aves marinas que nidifican en los acantilados son frecuentes en estas aguas ya que constituyen un lugar habitual de alimentación. En invierno es frecuente Sterna sandvicensis. Otras especies que se han incluido con motivo D son Larus cachinans, que también nidifica en el área y otras cuatro especies invernantes y migrantes regulares aunque no abundantes, como son Alca torda, Fratercula arctica, Larus ridibundus y Larus fuscus.
